What is SpamRescue and How Does It Work?

Every business that relies on email eventually loses something important to spam. A client sends a quote request, a booking inquiry, or a signup confirmation, and instead of reaching the inbox, it gets buried by an overly aggressive spam filter. Nobody notices until the opportunity is already cold. SpamRescue was built to catch exactly these moments, scanning spam folders across multiple mailboxes and surfacing the messages that are actually legitimate.

- **Mailbox Connection:** SpamRescue connects to any mailbox through IMAP, including Google Workspace, Microsoft 365, Outlook, Zoho, Fastmail, and Apple Mail. Personal Gmail and Outlook accounts work too, using app passwords.
- **Spam Only Review:** The tool looks only at what a spam filter has already caught. It never touches the inbox, never reroutes mail, and never rewrites existing filters.
- **Rules-Based Scoring:** Every message is scored using sender signals and customizable keyword rules rather than a machine learning model. Messages that resemble genuine client communication rise to the top of the queue.
- **Consolidated Queue:** Flagged messages from every connected mailbox appear together in one view, replacing the need to log into several accounts individually.
- **One Click Rescue:** A single click promotes a legitimate message back into the inbox, while anything left behind stays untouched in spam.
- **Privacy By Design:** SpamRescue reads headers rather than full message content and stores only sender, subject line, score, and timestamp information, never the body of a message.

SpamRescue is offered on Free, Starter, and Professional plans, with pricing based on mailbox count and scan frequency. For any business relying on email to bring in leads, a missed message sitting quietly in spam is a cost that never shows up on a report, and SpamRescue exists to make sure that cost stops happening silently.
